Tectonic Geomorphology

Synopsis

Tectonic geomorphology is the study of the interplay between tectonic and surface processes that shape the landscape in regions of active deformation and at time scales ranging from days to millions of years. Over the past decade, recent advances in the quantification of both rates and the physical basis of tectonic and surface processes have underpinned an explosion of new research in the field of tectonic geomorphology. Modern tectonic geomorphology is an exceptionally integrative field that utilizes techniques and data derived from studies of geomorphology, seismology, geochronology, structure, geodesy, stratigraphy, meteorology and Quaternary science. While integrating new insights and highlighting controversies from the ten years of research since the 1st edition, this 2nd edition of Tectonic Geomorphology reviews the fundamentals of the subject, including the nature of faulting and folding, the creation and use of geomorphic markers for tracing deformation, chronological techniques that are used to date events and quantify rates, geodetic techniques for defining recent deformation, and paleoseismologic approaches to calibrate past deformation. Overall, this book focuses on the current understanding of the dynamic interplay between surface processes and active tectonics. As it ranges from the timescales of individual earthquakes to the growth and decay of mountain belts, this book provides a timely synthesis of modern research for upper-level undergraduate and graduate earth science students and for practicing geologists. Book Information

Paperback: 460 pages

Publisher: Wiley-Blackwell; 2 edition (November 21, 2011)

Language: English

ISBN-10: 1444338870

ISBN-13: 978-1444338874

Product Dimensions: 7.6 x 0.9 x 9.7 inches

Shipping Weight: 2.4 pounds (View shipping rates and policies)

Average Customer Review: 5.0 out of 5 stars 4 customer reviews

Best Sellers Rank: #712,676 in Books (See Top 100 in Books) #16 in Books > Science & Math > Earth Sciences > Geology > Structural #28 in Books > Science & Math > Earth Sciences > Geology > Geomorphology #1985 in Books > Textbooks > Science & Mathematics > Earth Sciences

Customer Reviews

“Finally, it is worth mentioning that, unusually, this book comes with an electronic supplement readily available on the web that includes all figures, plates, and tables to be used in lectures by anyone, making this book a must-have for anyone teaching tectonic geomorphology or interested in this topic. Kodama intelligently summarizes achievements in the field of sedimentary paleomagnetism, where he also plays an important role.” (Pure Appl. Geophys, 1 January 2015)

“In summary, Tectonic Geomorphology is a nicely written, finely illustrated, rich and, above all, thought provoking textbook. I believe it will be extremely useful not only for graduate students, but also for those more mature scientists who left school before the onset of what I consider the most exciting advancement in the Earth Sciences after Plate Tectonics.” (J Seismol, 1 March 2013)

“This is an excellent second edition of Tectonic Geomorphology and is highly recommended to geologists and geomorphologists with an interest in neotectonics and landscape evolution.” (Geological Journal, 29 January 2014)

“In summary, Tectonic Geomorphology is a well-thought-out and well-executed text that well serves teaching of the subject at graduate and upper levels, and it provides a valuable reference for practicing geologists.” (Environmental & Engineering Geoscience, 2 May 2013)

“This is definitely a book worth taking a look at by any member; and one worth trying hard to come to terms with if aspects of this important subject really interest you.” (Open University Geological Society Journal, 1 November 2012)

“Notwithstanding this, I strongly recommend to have Tectonic Geomorphology on one’s bookshelf. It will be of particular value to the young generation of geoscientists, wondering which research direction to go. They will get first-class food-for-thought.” (Geologos, 2012)

Tectonic geomorphology is the study of the interplay between tectonic and surface processes that shape the landscape in regions of active deformation and at time scales ranging from days to millions of years. Over the past decade, recent advances in the quantification of both rates and the physical basis of tectonic and surface processes have underpinned an explosion of new research in the field of tectonic geomorphology. Modern tectonic geomorphology is an exceptionally integrative field that utilizes techniques and data derived from studies of geomorphology, seismology, geochronology, structure, geodesy, stratigraphy, meteorology and Quaternary science. While integrating new insights and highlighting controversies from the ten years of research since the 1st edition, this 2nd edition of Tectonic Geomorphology reviews the fundamentals of the subject,

including the nature of faulting and folding, the creation and use of geomorphic markers for tracing deformation, chronological techniques that are used to date events and quantify rates, geodetic techniques for defining recent deformation, and paleoseismologic approaches to calibrate past deformation. Overall, this book focuses on the current understanding of the dynamic interplay between surface processes and active tectonics. Innovative

great

Tough reading, but you can get it after re-reading the paragraph a few times.

Great book, recieved it quickly!
